

OVALIS

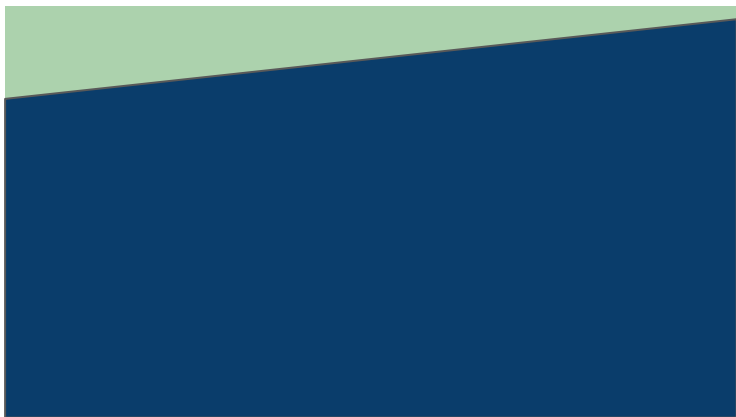

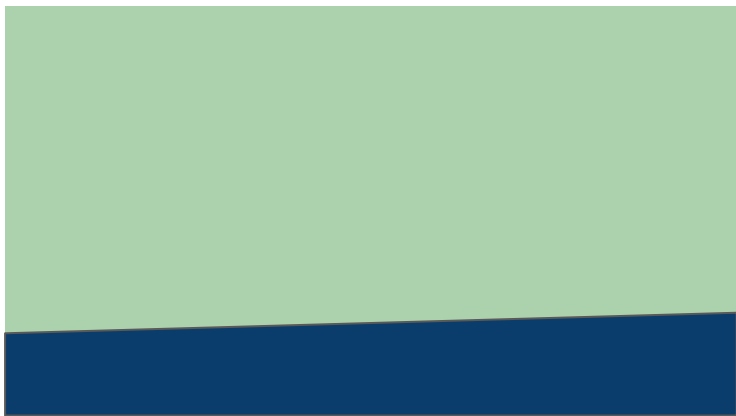

When user first opens page, it loads slowly like this about 0.5-1.5 seconds. One thin line slides as loading. Ovalis and line fade into view as loading continues.

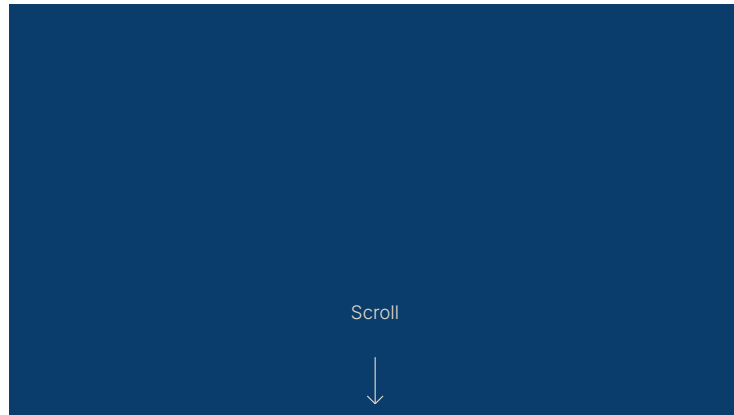

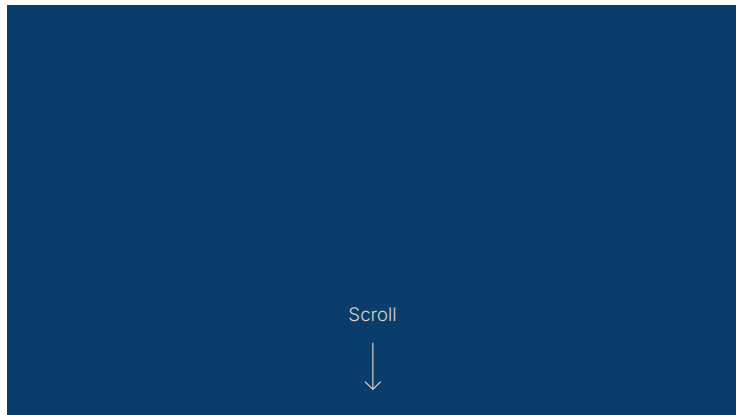

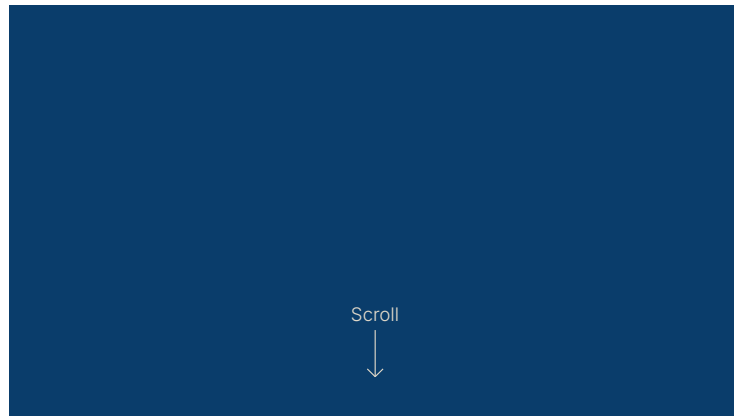

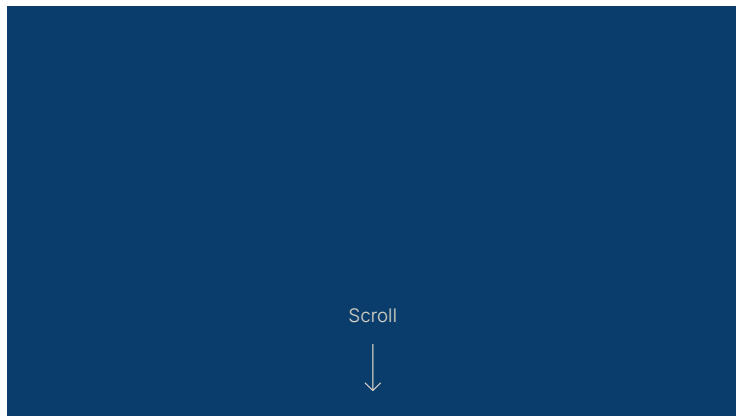

Once loading completes, Ovalis and completed loading line disappear quickly in about 0.4 seconds. Animations about to start

Animations start immediately like below. The navy slides up from the bottom asymmetrically to fill the screen completely.

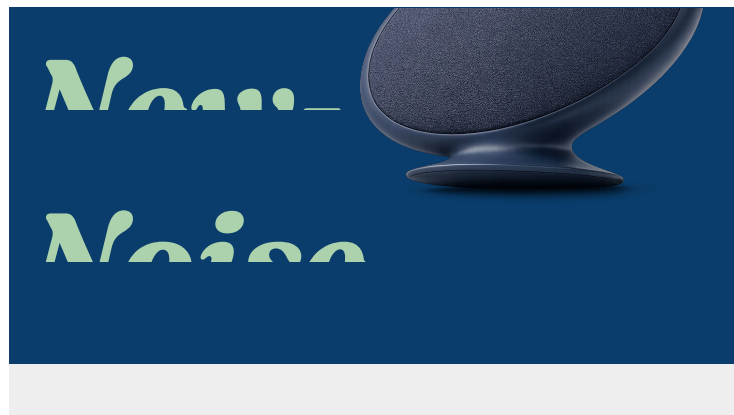

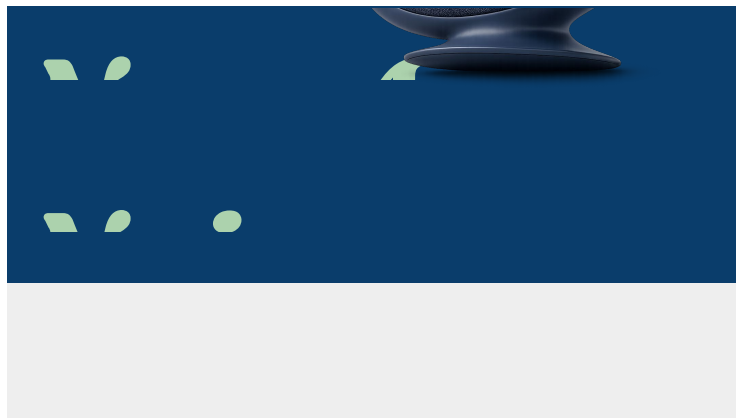

Scroll is available for the first time. Indicator shown to prompt user to scroll, but fades away as user starts scrolling. Scroll arrow will bounce up and down slowly, smoothly.

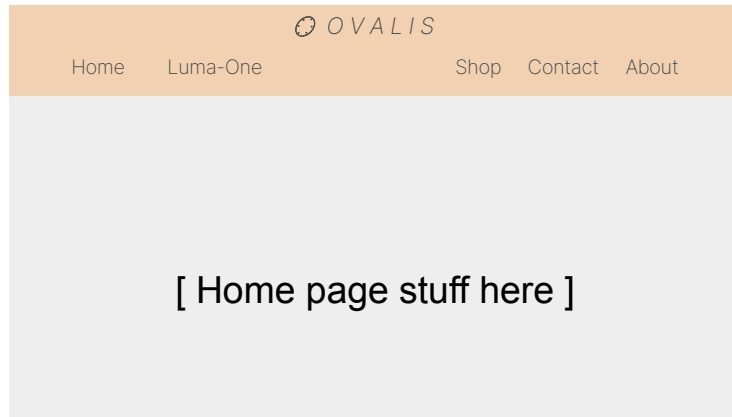

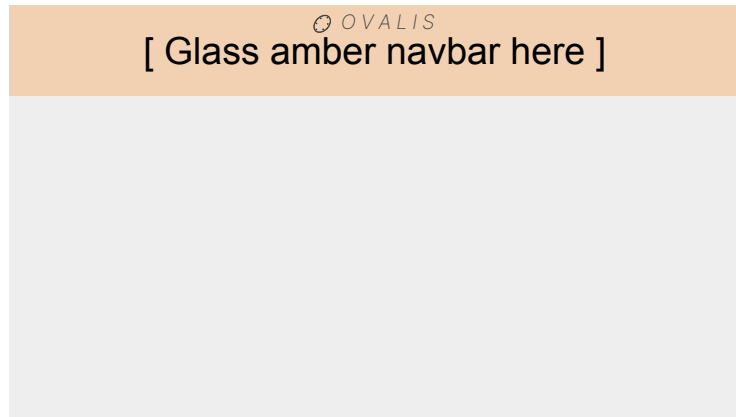

Once user scrolls, animations are advanced. User may scroll up/down to move forwards/backwards in the animation. Speaker [three.js](#) file required, which starts a little bigger to fill the bottom, and shrink a little to fit over the text, as shown. Text animation too.

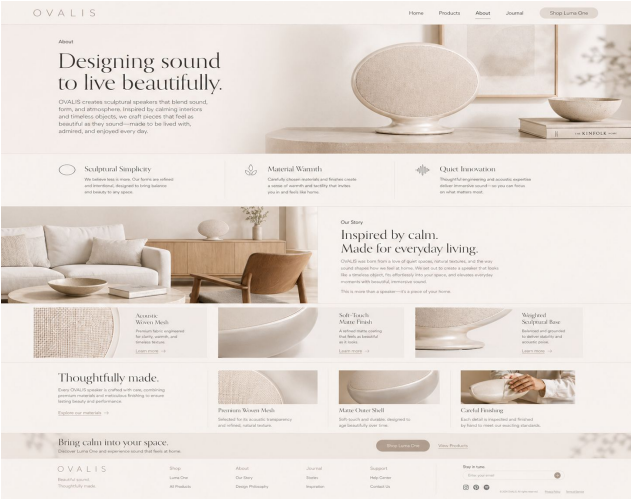

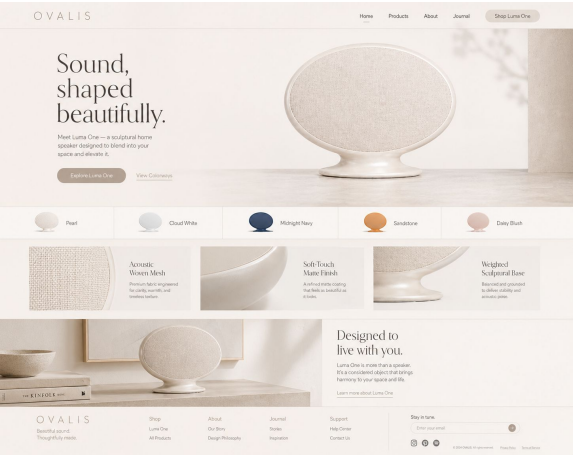

Now that animation is over, user will scroll to home page, but animation still may be reachable by scrolling up, but landing page will stay sticky to resist going up easily.

Navbar appears, coming down from the top of the screen smoothly just as the navy disappears, almost coming out from behind the navy. Navbar is a opaque ivory/amber glass texture/color (I wasn't able to get the exact look below). For the home page, there are very rough drafts right now. Please feel free to generate your own images, features, ideas, and graphics to beautify this.

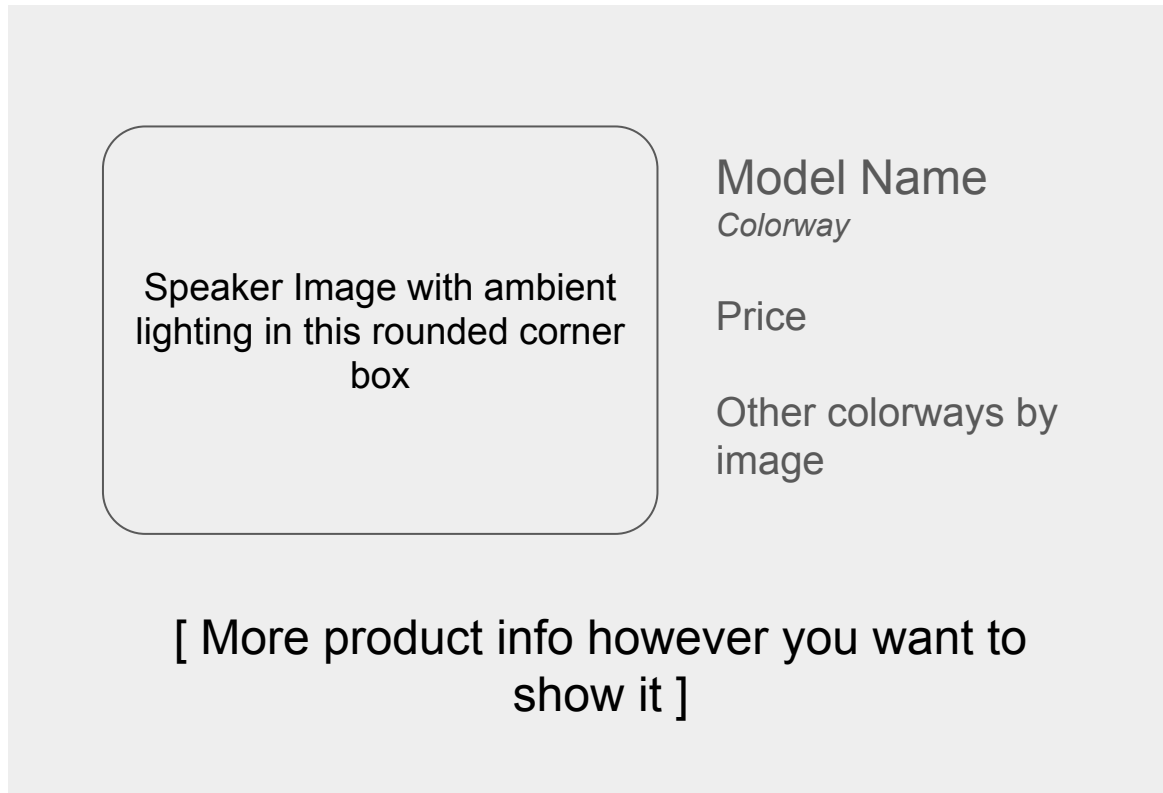

Random rough drafts (don't rely if you have better ideas.)

Finally the footer should have a smoke/concrete texture and color to feel light and natural (rough idea below, but make it more real). Also navbar disappears as user scrolls down into a little logo like the iphone apple island, also in a opaque glass texture. Scrolling up slightly anywhere on the page or hovering on the island will bring back the full navbar smoothly. You decide the shape and technology/graphics behind navbar.

Featuring the individual products once a product has been clicked on. Rough template below. Make the page's ambient light respond to the selected colorway to make the site feel alive.

The following slide will contain collections and example images/colorway names for each collection. Each colorway name may not have an image, so come up with the color. If an image is given for the colorway, use exactly that image. Don't use exactly that picture, unless possible. I prefer you recreate to make it perfectly seamless with the website.

Foundations collection:

- White
- Black
- Light Grey
- Dark Grey
- Navy
- Maroon
- Orange

Element collection:

- Wood
- Pearl
- Aluminum - Chrome
- Aluminum - Gold
- Aluminum - Rose Gold
- Sand
- Moss

Flores collection:

- Stem
- Sunshine
- Rosé
- Lavender
- Sky

If you have any other alternate ideas such as the following that you gave previously:

- Use the exploded-view diagram you already have as a scroll-driven sequence. It's the most "engineering luxury" thing in your sheet.
- One section that is almost entirely empty. White, one line of type, enormous margins. Restraint reads as confidence.
- Cursor as a soft spotlight that reveals the fabric weave texture.

Please feel free to create these. Make a section in the navbar called '**Test Pages**' and make it drop down all the alternate version of pages or additional page ideas or other little things you want to test on that drop down list that i can click and visit a sample page from. Feel free to make as many as you want. Me being able to visualize them fully is key.
